

LLVM AArch64

FOSDEM – LLVM dev room – February 2015
Kristof Beyls

Overview

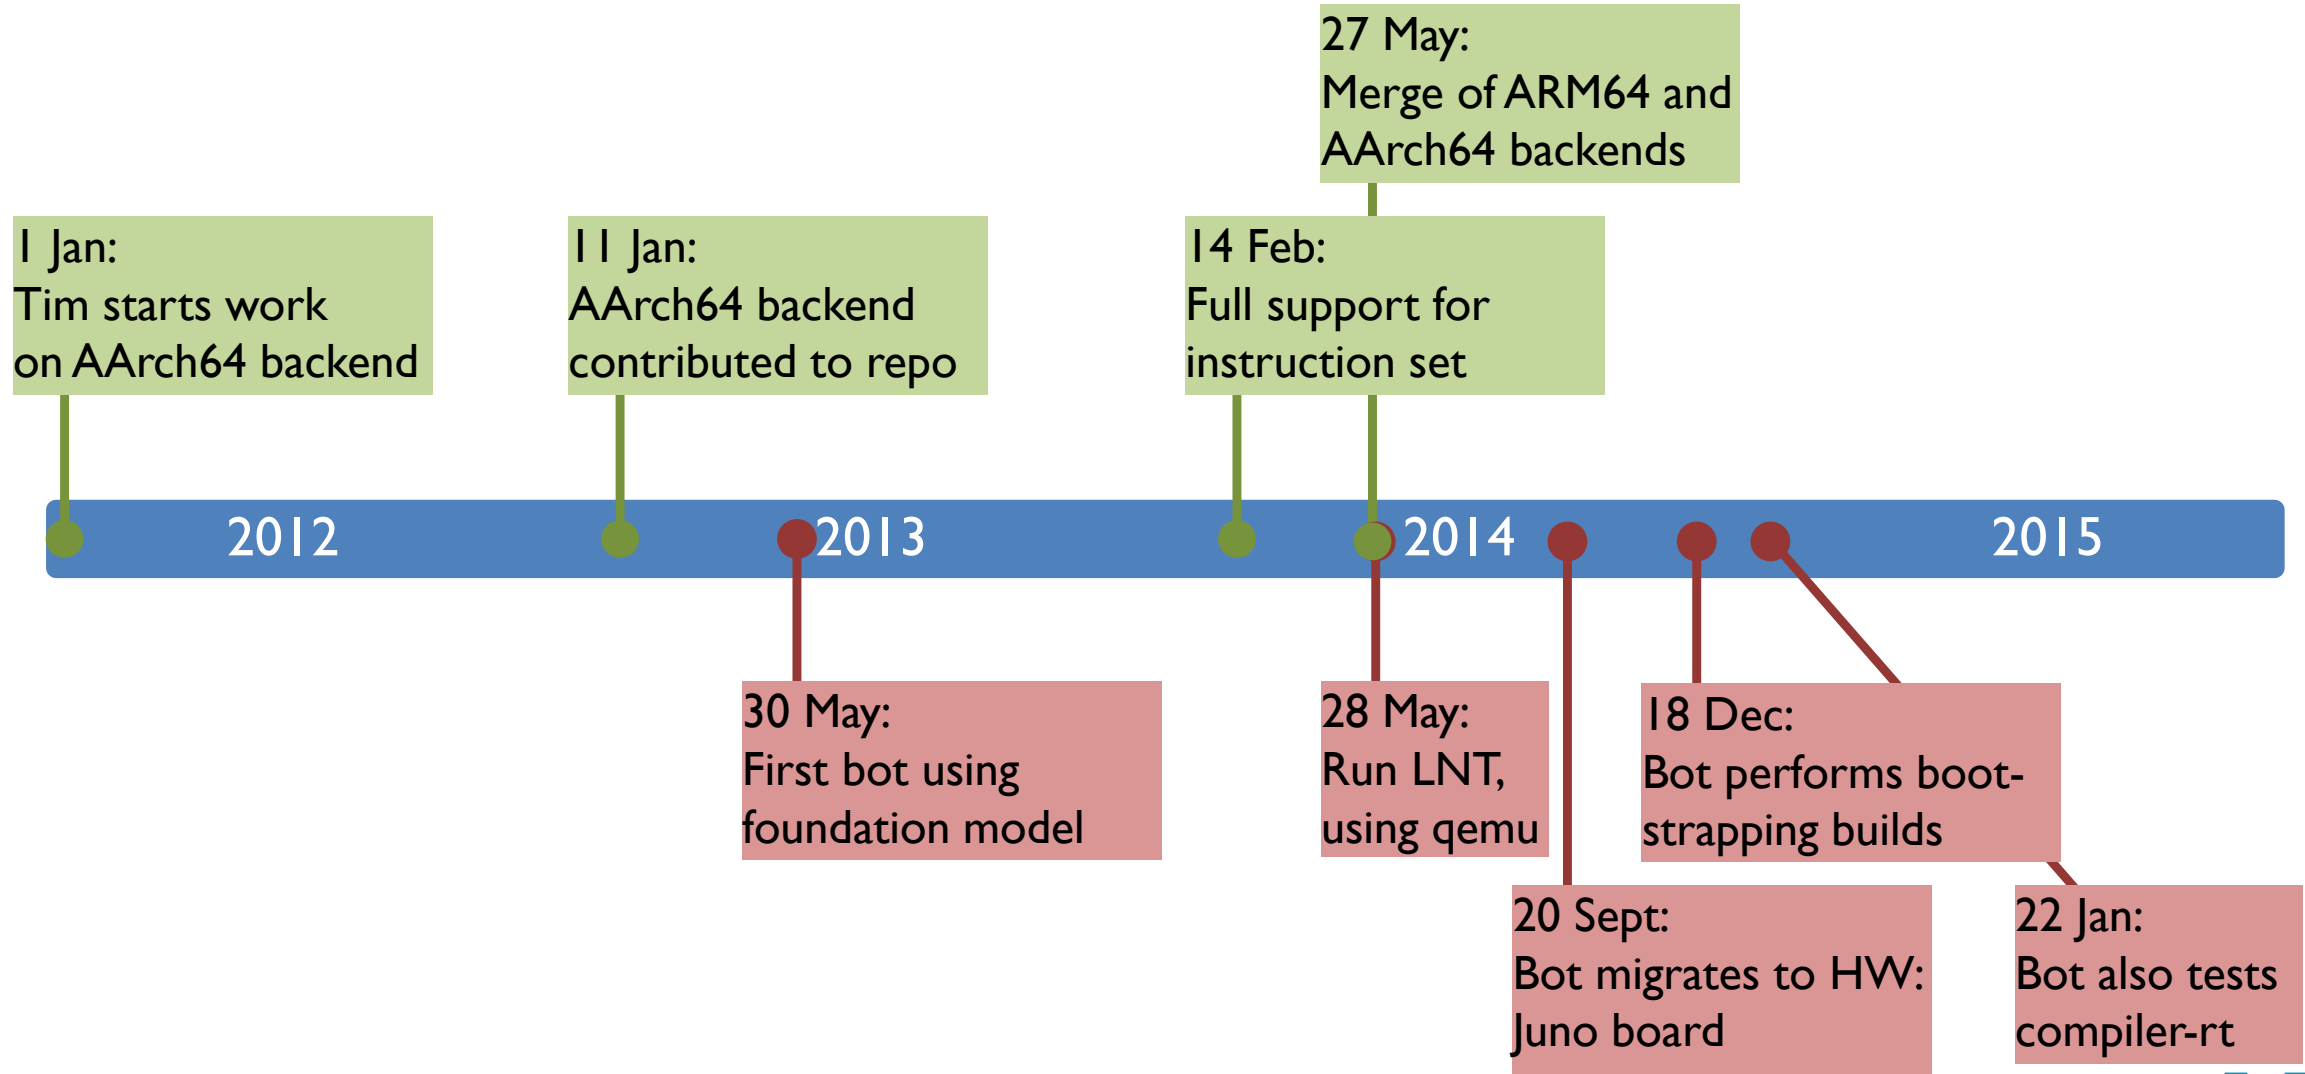

- Some history of how AArch64 support got added to clang & llvm.
- Current status of support for AArch64

What is AArch64?

History of support for AArch64 in LLVM

Timeline

Timeline

Focus on correctness.
LLVM isn't afraid of refactoring ->
regression tests at least as
important as code.

1 Jan:
Tim starts work
on AArch64 backend

11 Jan:
AArch64 backend
contributed to repo

14 Feb:
Full support for
instruction set

27 May:
Merge of ARM64 and
AArch64 backends

2012

2013

2014

2015

30 May:
First bot using
foundation model

28 May:
Run LNT,
using qemu

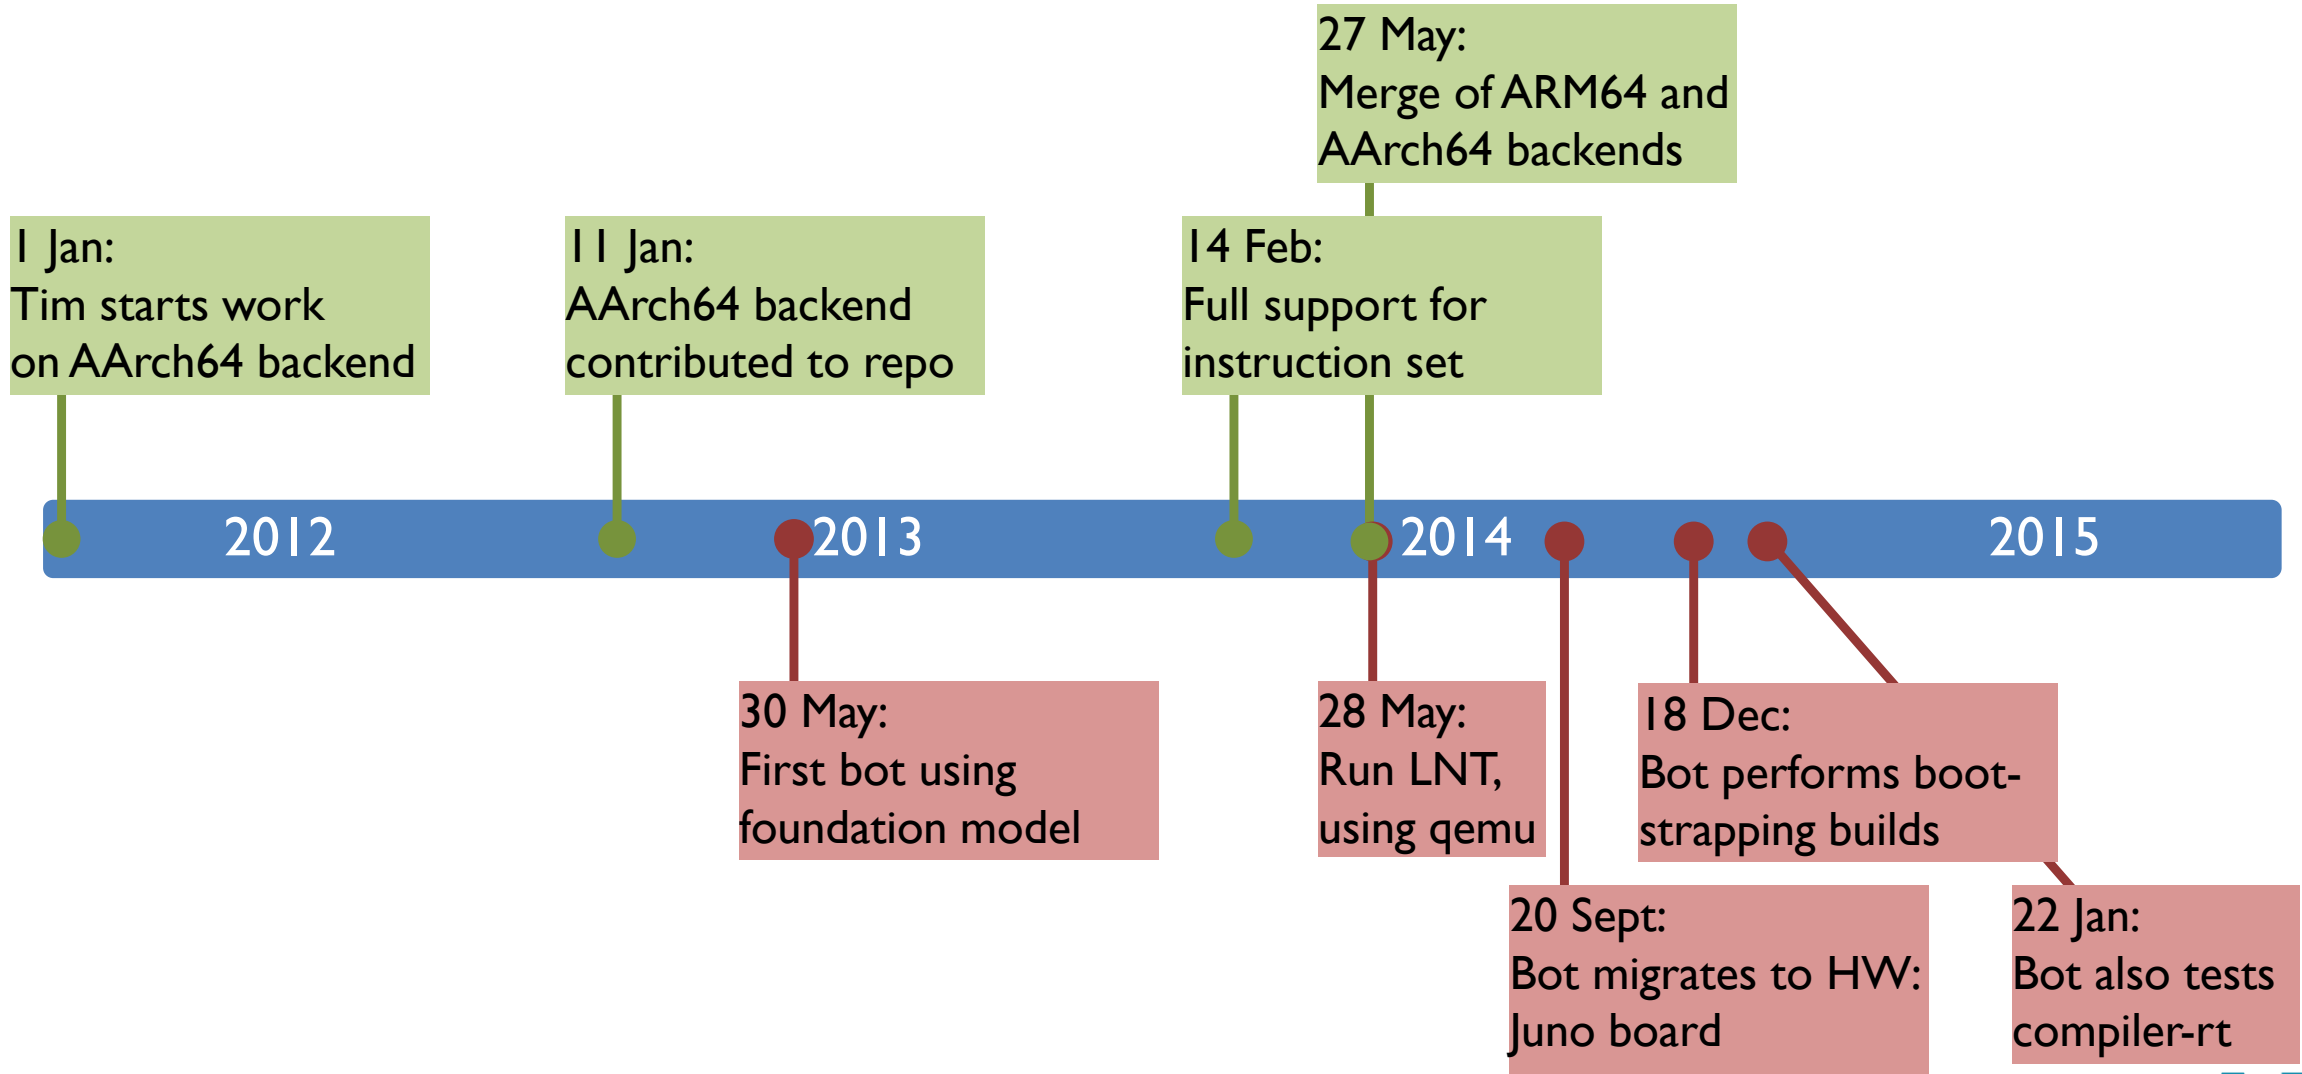

18 Dec:
Bot performs boot-
strapping builds

20 Sept:
Bot migrates to HW:
Juno board

22 Jan:
Bot also tests
compiler-rt

Focus on correctness.
LLVM isn't afraid of refactoring; regression
tests can't cover everything -> buildbots
provide important additional test
coverage

Timeline

Cortex-A57 performance on linux Juno platform clang and gcc over time

Current status of support for AArch64

What works?

- Lots
 - C & C++ generally just works
 - Little endian & Big endian
 - Neon intrinsics
 - Performance of generated code getting improved all the time.

Some missing features

- Buildbots tracking performance of generated code
- Straightforward link time optimizations, due to lack of open source linkers integrating with LLVM for LTO and supporting AArch64 – *although AArch64 support in gold is actively being developed/almost done now?*
- ILP32
- More not-frequently-used features are discovered over time, as more software gets pushed through the backend. Two examples from last month:
 - no support for over-aligned stack objects
 - Thread-Local Storage: llvm produces relocations that linkers on AArch64-linux can't handle yet.

Status of AArch64 support in other LLVM sub-projects

- Most projects use top-of-trunk LLVM
- Therefore, the best way to monitor the status of a given subproject is to look at the current status of the LLVM buildbots testing the particular subproject.
- For the main sub-projects other than clang (front end) or LLVM (mid-end and backend), there currently isn't any AArch64 buildbot, so the status is a bit unclear:
 - Compiler-rt (builtins/libgcc-equivalent): *buildbot is running the tests since very recently.*
 - Compiler-rt (sanitizers): *buildbot is running the tests since very recently.*
 - Libc++/libc++abi: should be largely working?
 - Lld: largely not working, but active development is going on?
 - Lldb: ?

Summary

- AArch64 backend has been available in llvm.org for 2 years.
- Major steps forward last year
 - Basic full support for the architecture in front-end & back-end.
 - Generated code has reasonable performance.
- Status of support for AArch64 in the various LLVM sub-projects is a bit unclear at the moment.
